- ▶ Introduction
- ▶ Airflow control
- ▶ Monitoring
- ▶ PUE
- ▶ Conclusion

- ▶ HPC Center of University of Strasbourg (France)
- ▶ <http://hpc.unistra.fr>
- ▶ 300 HPC Servers, Linux, Infiniband Network, ...
- ▶ Cold Aisle and Hot Aisle confinement for high-density racks (35kw / rack)
- ▶ 28°C in front of the servers
- ▶ Free-Chilling
- ▶ Server room totally re-designed for HPC

Introduction (2/3)

Do-it yourself
traditional DC

Helsinki, September 11th, 2014
Campus Best Practices – Datacenter IAAS
Workshop

- ▶ This talk is about re-configuring an existing machine-room into an up-to-date Datacenter
- ▶ It is based on:
 - our experience in realizing datacenters
 - several visits of datacenters in France (thanks to the hosts)
- ▶ This talk focuses on practical improvements you can realize

- ▶ Introduction
- ▶ Airflow control
- ▶ Monitoring
- ▶ PUE
- ▶ Conclusion

Your old / current DC

Do-it yourself
traditional DC

Helsinki, September 11th, 2014
Campus Best Practices – Datacenter IAAS
Workshop

► Let's bet your current DC looks like:

- ▶ Most probably hot air and cold air mix everywhere in the room :

Here hot air comes back to front because of a missing filler

Courtesy Bernard Boucherin
(LPSC – CNRS - France)

- ▶ Problem: hot air arriving on the front-side of the servers.
- ▶ Cooling more expensive (fan speed increases)
- ▶ Solution: a plastic filler (max several €)

- ▶ Anywhere in the room, you should control airflow in order to minimize the quantity of hot air recirculating in front of the servers without going through the cooling
- ▶ This is usually done by aisle confinement
- ▶ You can approximate aisle confinement by putting (metal) panels around your racks. α 100 €
- ▶ In progress in Peugeot, Montbéliard, France, based on a idea from Bernard Barrois

May convince your security staff that this is fire-safe !

- ▶ To create low-cost hot / cold aisles in an existing room, you can as well:
 - add plexiglas roofs across racks;
 - on both sides, close the aisles using plastic curtains.
- ▶ Next slide: server room of the Institut Pierre et Simon Laplace, Paris (thanks to Franck Corsini):

Airflow: plastic curtains

Do-it yourself
traditional DC

Helsinki, September 11th, 2014
Campus Best Practices – Datacenter IAAS
Workshop

- ▶ Cost: 5300€ for the metal frame and the curtains, for 9 racks (600 € / rack)
- ▶ Company: ODC (Optimal Data Center)

Airflow: what about free-cooling ?

Do-it yourself
traditional DC

Helsinki, September 11th, 2014
Campus Best Practices – Datacenter IAAS
Workshop

- ▶ In order to be able to go for free-cooling, you need:
 - a source of fresh air **from** the outside;
 - an air output, **to** the outside;
 - on the outside, input and output should not be too close one from the other (several meters)
 - depending on the fresh air temperature, you may want to mix hot air and cold air in order to heat the cold air (winter....)
- ▶ A reminder: Ashrae A2 (2011, 3 years ago...) allows 35°C 100% of the year in front of the servers

Airflow: what about free-cooling ?

Do-it yourself
traditional DC

Helsinki, September 11th, 2014
Campus Best Practices – Datacenter IAAS
Workshop

- ▶ On 1st try, you can only try and collect and get rid of the hot air;
- ▶ You can put an air-extractor on the back-side of your racks
- ▶ Done at Observatoire de Paris (thanks to Emmanuel Halbwachs):
- ▶ Based on:

http://www.apc.com/products/resource/include/techspec_index.cfm?base_sku=ACF400

Airflow: what about free-cooling ?

Do-it yourself
traditional DC

Helsinki, September 11th, 2014
Campus Best Practices – Datacenter IAAS
Workshop

To the outside

- ▶ Cost: around 2500€ for the air-extractor
- ▶ Should be able to extract 17kw of hot air
- ▶ Input air comes from the computer room (leave door open !)

Airflow: what about free-cooling ?

Do-it yourself
traditional DC

Helsinki, September 11th, 2014
Campus Best Practices – Datacenter IAAS
Workshop

- ▶ You can then try and inject air from the outside
- ▶ Made by the Ciment team in Grenoble (Françoise Roch, Olivier Richard, Christian Seguy, Pierre Neyron)
- ▶ https://2011.jres.org/archives/90/paper90_poster.pdf
- ▶ http://wiki-oar.imag.fr/index.php/FrigID_construction
- ▶ For the box around the servers, they used a shower cabin bought in a general-purpose store !

Airflow: what about free-cooling ?

Do-it yourself
traditional DC

Helsinki, September 11th, 2014
Campus Best Practices – Datacenter IAAS
Workshop

- ▶ Cost: 3000€ (HPC machine was 75 k€)
- ▶ Watch out for insulation!
- ▶ Observed front-side temperature: 33°C max

Professional fan

Airflow: what about free-cooling ?

Do-it yourself
traditional DC

Helsinki, September 11th, 2014
Campus Best Practices – Datacenter IAAS
Workshop

- ▶ The previous installation has no heat exchanger. You can add one by upgrading the fan to a real exchanger
- ▶ Made in a bigger installation by **Bernard Bouterin** (CNRS, LPSC, Grenoble) **since 2008**
- ▶ <http://informatique.in2p3.fr/?q=node/290>
- ▶ Cost: 60k€ for 80kw IT. Refund in less than 5 years
- ▶ Very few air-condition failures
- ▶ Free-Cooling used 84% of time

Airflow: what about free-cooling ?

coarse and fine
grain)

- ▶ Introduction
- ▶ Airflow control
- ▶ Monitoring
- ▶ PUE
- ▶ Conclusion

- ▶ Some Datacenter vendors offer complete all-in-one monitoring solutions
- ▶ You can get good approximate using standard tools, namely SNMP, IPMI, Ganglia
- ▶ Monitoring is about extracting environmental data from your Datacenter:
 - Power consumption
 - Temperatures
 - Pressures
 - ...

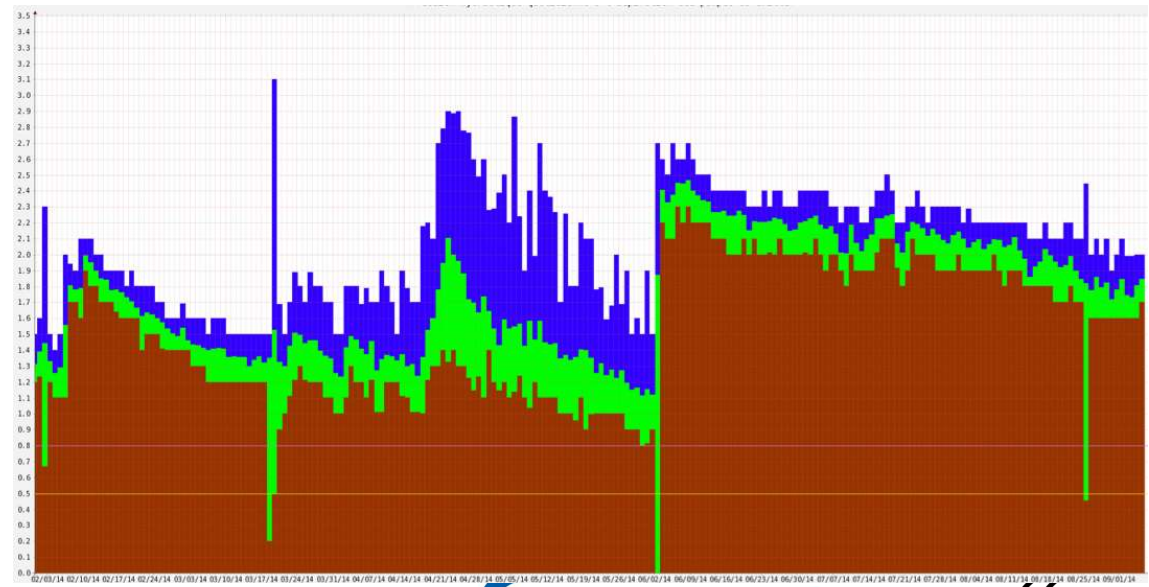

- ▶ When it comes to power consumption, you can use a monitored / managed PDU (≈ 30 € per plug)
- ▶ For instance:
http://www.apc.com/products/resource/include/techspec_index.cfm?base_sku=AP7900
- ▶ Ask for the MIB!
- ▶ Optionnal temperature sensors available
- ▶ IPMI allows monitoring for free, too (temperature, wattage)

Monitoring – Out of IT

Do-it yourself
traditional DC

Helsinki, September 11th, 2014
Campus Best Practices – Datacenter IAAS
Workshop

- ▶ Even if you bought a modern cooling system, you may not use all of its (hidden) features
- ▶ You can probably query your system via snmp, and retrieve very interresing environmental values : pressures, water temperatures
- ▶ Here is what we get:
(average pressures, for diagnostic purposes)
- ▶ Think about parsing web interfaces output, too

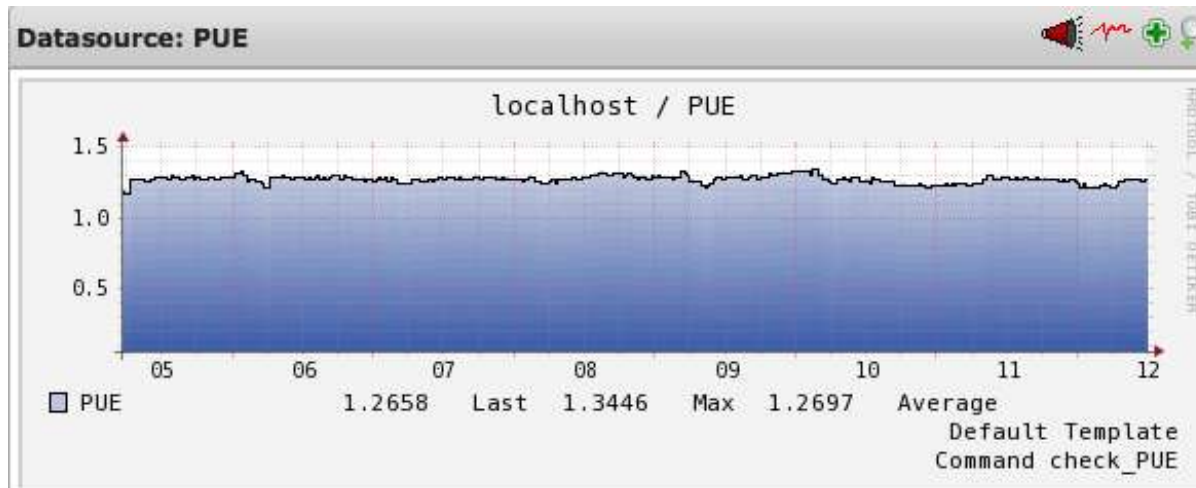

- ▶ You can retrieve a lot of useful information for free, using very simple tools and queries
- ▶ Several software are available in order to gather data
- ▶ You can easily build your own data-center management software!

- ▶ Introduction
- ▶ Airflow control
- ▶ Monitoring
- ▶ PUE
- ▶ Conclusion

- ▶ In order to compute PUE, you need to measure:
 - Total IT Power, either wattage (W) or overall consumption (kWh)
 - Total Facilities Power
- ▶ We now have enough data to get an estimate of the PUE
- ▶ If one data is missing, you can try and deduce it:
 - In Strasbourg, we measure the total Datacenter power. Data source: CTM / modbus
 - We subtract from it the sum of the cooling system. Data source: Snmp on the chiller / exchangers

- ▶ PUE can then be integrated into Ganglia / Nagios

- ▶ Don't hesitate to communicate on the PUE

- ▶ Introduction
- ▶ Airflow control
- ▶ Monitoring
- ▶ PUE
- ▶ Conclusion

Conclusion

- ▶ There are many solutions in order to optimize your Datacenter
- ▶ Airflow is the 1st thing to look at
- ▶ A bit of time and small amounts of money can really help you transform your DC
- ▶ Monitoring will help you to measure the effects of your trial-and error steps
- ▶ Keep in mind to give your ideas a try in non-critical rooms (typically : HPC rooms)
- ▶ You may be the one who inovate !

- ▶ Introduction
- ▶ Airflow control
- ▶ Monitoring
- ▶ PUE
- ▶ Conclusion
- ▶ Additional slides

Airflow: panels

- ▶ Here is the simulation of the airflow in a machine room with panels on the top and on both sides

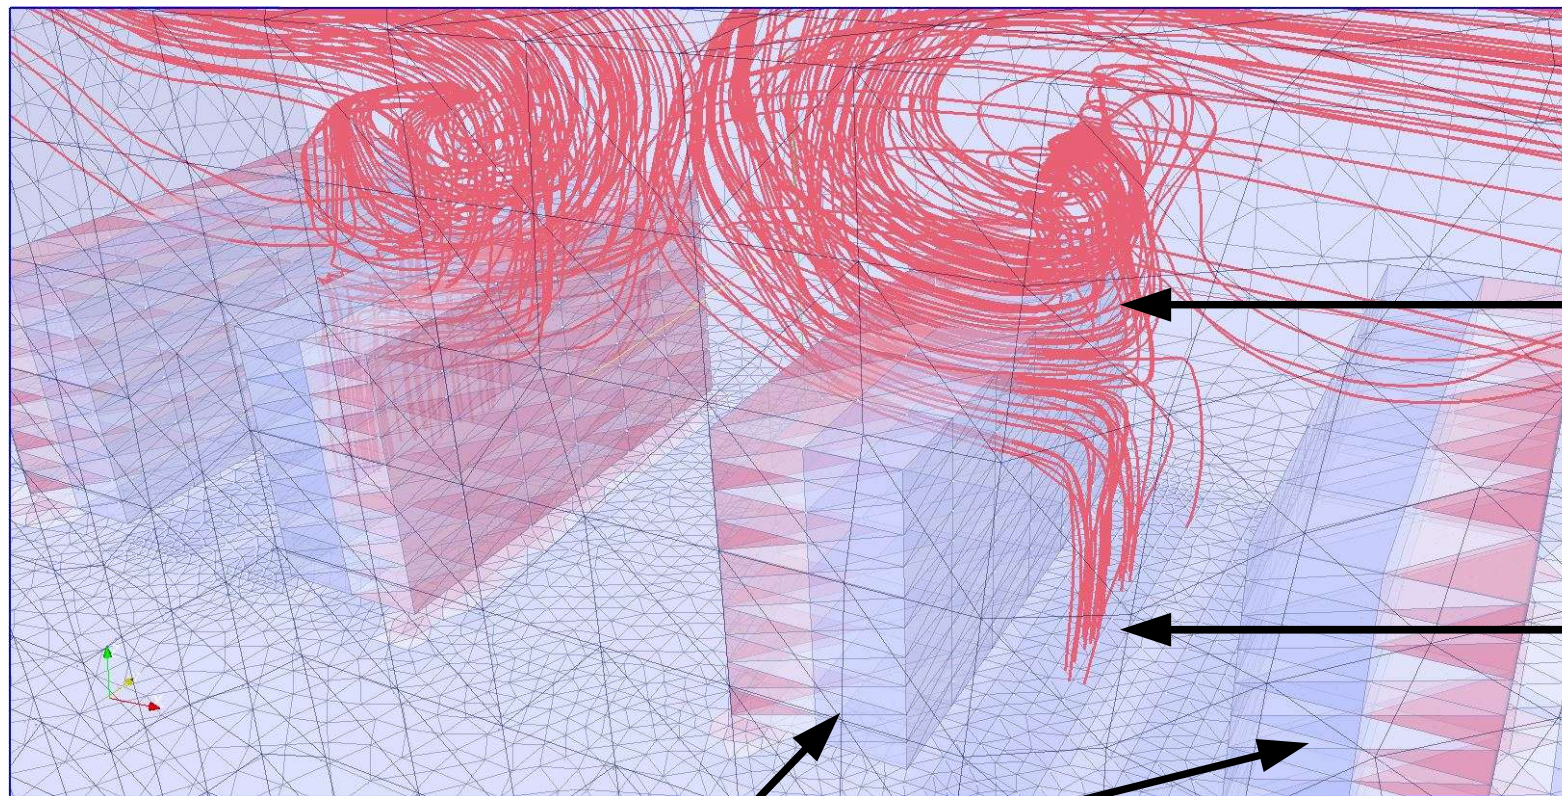

3 panels (Π) on the rear sides of racks

Set of racks

Airflow : panels

- ▶ Here is the simulation of the airflow in a machine room without panels on the top and on both sides

Hot air from
the back
re-circulates

Front side
of the racks

Set of racks

- ▶ This simulator was written in a project involving:
 - PSA (French Automotive Industry), Bernard Barrois
 - GdS Ecoinfo, Romaric David, and internship of Mohcine El BarhBarh
 - University of Strasbourg/Icube: Yannick Hoarau
- ▶ Cost for the panels: several hundred €, and a few screws
- ▶ Customized metal panels available on several websites

Airflow: what about free-cooling ?

► Block Diagram:

Heat exchanger
(cold water from an
existing network)

▶ IPMI example: a server from 2008 (HP DL165 G5)

```
> ipmitool -I lan -H [host] -U [user] -f [file containing IPMI user  
password] sdr type Temperature
```

CPU0 Diode	20h	ok	3.0	48.50 degrees C
CPU1 Diode	22h	ok	3.1	51 degrees C
Power Ambient	24h	ok	0.0	16 degrees C
CPU0 Prochot	07h	ok	3.0	Limit Not Exceeded
CPU1 Prochot	08h	ok	3.1	Limit Not Exceeded

▶ IPMI example: a server from 2013 (Supermicro)

```
> ipmitool -I lan -H [host] -U [user] -f [file containing IPMI user  
password] sdr type Temperature
```

CPU1 Temp	01h	ok	3.1	68 degrees C
CPU2 Temp	02h	ok	3.2	62 degrees C
System Temp	11h	ok	7.1	35 degrees C
Peripheral Temp	12h	ok	7.2	56 degrees C
IB Temp	13h	ok	7.5	55 degrees C
PCH Temp	0Ah	ok	7.3	57 degrees C
P1-DIMMA1 TEMP	B0h	ok	32.64	40 degrees C
P1-DIMMB1 TEMP	B4h	ok	32.65	39 degrees C
P1-DIMMC1 TEMP	B8h	ok	32.68	41 degrees C
P1-DIMMD1 TEMP	BCh	ok	32.69	40 degrees C
P2-DIMME1 TEMP	D0h	ok	32.72	34 degrees C
P2-DIMMF1 TEMP	D4h	ok	32.73	35 degrees C
P2-DIMMG1 TEMP	D8h	ok	32.76	33 degrees C
P2-DIMMH1 TEMP	DCh	ok	32.77	35 degrees C

- ▶ Getting the temperature server by server can give you quite a good overview of the temperature of your room
- ▶ May need a bit of scripting to integrate into ganglia/nagios
- ▶ You may select the sensor closest from the server air inlet
- ▶ The same standard Ipmi command can be used to query servers from different vendors

- ▶ Some proprietary commands or extensions can retrieve the power consumption

```
./SMCIPMITool 192.168.4.92 login password pminfo  
[SlaveAddress = 78h] [Module 1]
```

← Example from
Supermicro

Item	Value
-----	-----
Input Voltage	226.5 V
Input Current	2.17 A
Main Output Voltage	12.07 V
Main Output Current	34.75 A
Main Output Power	416 W
Input Power	472 W

- ▶ To get the consumption of the whole datacenter, you need to sum server by server

- ▶ To get more accurate measurements of power consumption without a managed PDU, you may be able to query the electric distribution modules (do-it-yourself Centralized Technical Management)
- ▶ This is usually done through the modbus protocol
- ▶ You need the *modbus address* in order to query the device
