

## T1.2: Developing prototypes with learner perspective

In the CompLeap project we are producing testable prototypes, which are linked to the [framework architecture developed in WP2](#).

### Four Phases of Development

1. **Mapping architecture** – initial mapping of current service framework
2. **Mock up prototype** – visual screenshots of the modules for testing a concept
3. **HTML prototype** – more functionalities than a mock-up proto showcasing full framework
4. **Beta-pilot** – final prototype proving certain functionalities of the planned framework

### Learner Centered Service Design

The learners needs have been at the center of the service design process. Learners and guidance counselors have been at the center of service planning and needs analysis from the very beginning. Learners are included in the testing and piloting of the prototypes.

The learner's pathway is main value stream in the CompLeap framework, and defines the steps the learner takes to increment hers or his competence.
